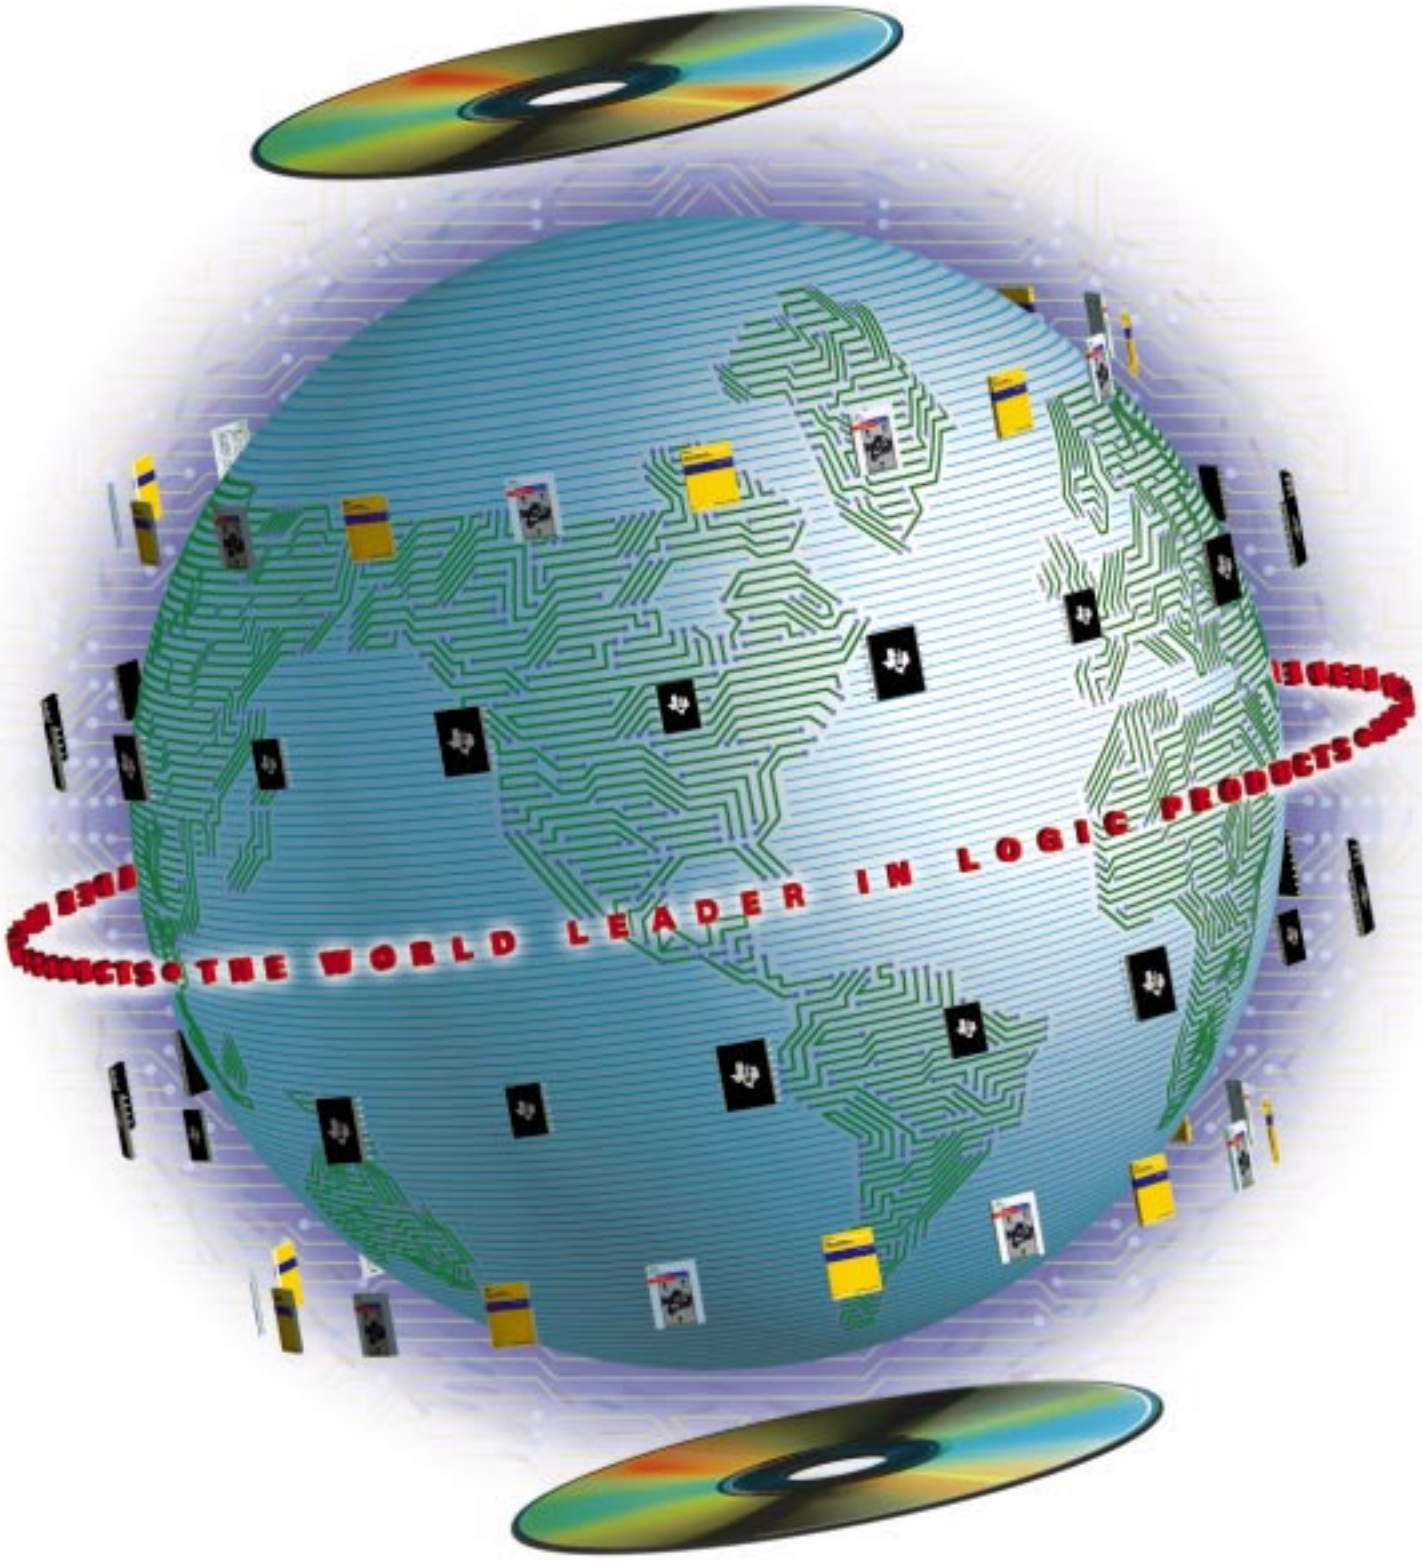
Logic Selection Guide

August 1998



LOGIC SELECTION GUIDE

AUGUST 1998

TEXAS INSTRUMENTS

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.

TEXAS INSTRUMENTS
P.O. Box 84, M/S 835
Sherman, TX 75091 USA
Fax: (903) 868-5980

Texas Instruments (TI™) offers a full spectrum of logic functions and technologies from the mature to the advanced, including bipolar, BiCMOS, and CMOS. TI's process technologies offer the logic performance and features required for the most modern logic designs, while maintaining support for more traditional logic products. TI's offerings include products in the following process technologies:

- AC, ACT, AHC, AHCT, ALVC, HC, HCT, LV, LVC
- ABT, ABTE, ALB, ALVT, BCT, HSTL, LVT, SSTL
- BTA, CBT, CBTLV, FB, FIFO, GTL, JTAG
- ALS, AS, F, LS, S, TTL

TI offers specialized, advanced logic products that improve overall system performance and address design issues, including testability, low skew requirements, bus-termination memory drivers, and low-impedance drivers.

TI offers a wide variety of packaging options, including advanced surface-mount packaging, such as the plastic thin quad flatpack (TQFP), shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), and thin very small-outline package (TVSOP). These packages deliver high performance and allow the designer to double input/output density in the same circuit board area or to reduce the board area by one-half, compared to standard packaging technology.

For further information on TI logic families, refer to the list of current TI logic technical documentation provided in this preface. For an overview of TI logic, see Section 1. Sections 2, 3, and 4 are a functional index, functional cross-reference, and device selection guide, respectively. These sections list the functions offered, package availability, and applicable literature numbers for each device. The literature number shown is for the current data sheet (as of publication date). Copies of data sheets can be ordered through your local sales office or TI authorized distributor, or downloaded from the internet at http://www.ti.com. Please see the back cover of this selection guide for additional information.

CURRENT TI LOGIC TECHNICAL DOCUMENTATION

Listed below is the current collection of TI logic technical documentation. These documents can be ordered through a TI representative or authorized distributor by referencing the appropriate literature number.

Document	Literature Number
ABT Logic Advanced BiCMOS Technology Data Book (1997)	SCBD002C
AC/ACT CMOS Logic Data Book (1997)	SCAD001D
Advanced Bus-Interface SPICE I/O Models Data Book (1995)	SCBD004A
AHC/AHCT Logic Advanced High-Speed CMOS Data Book (1997)	SCLD003A
AHC/AHCT Designer's Guide (1998)	SCLA013
ALS/AS Logic Data Book (1995)	SDAD001C
ALVC Advanced Low-Voltage CMOS Data Book (1998)	SCED006
BCT BiCMOS Bus-Interface Logic Data Book (1994)	SCBD001B†

Example:

1 Standard Prefix

Example: SNJ – Conforms to MIL-PRF-38535 (QML)

2 Temperature Range

Examples: 54 – Military
74 – Commercial

3 Family

Examples: Blank – Transistor-Transistor Logic
ABT – Advanced BiCMOS Technology
ABTE – Advanced BiCMOS Technology/ Enhanced Transceiver Logic
AC/ACT – Advanced CMOS Logic
AHC/AHCT – Advanced High-Speed CMOS Logic
ALB – Advanced Low-Voltage BiCMOS
ALS – Advanced Low-Power Schottky Logic
ALVC – Advanced Low-Voltage CMOS Technology
AS – Advanced Schottky Logic
BCT – BiCMOS Bus-Interface Technology
CBT – Crossbar Technology
CBTLV – Low-Voltage Crossbar Technology
F – F Logic
FB – Backplane Transceiver Logic/Futurebus+
GTL – Gunning Transceiver Logic
HC/HCT – High-Speed CMOS Logic
HSTL – High-Speed Transceiver Logic
LS – Low-Power Schottky Logic
LV – Low-Voltage CMOS Technology
LVC – Low-Voltage CMOS Technology
LVT – Low-Voltage BiCMOS Technology
S – Schottky Logic
SSTL – Stub Series-Terminated Logic

4 Special Features

Examples: Blank = No Special Features
D – Level-Shifting Diode (CBTD)
H – Bus Hold (ALVCH)
R – Damping Resistor on Inputs/Outputs (LVCR)
S – Schottky Clamping Diode (CBTS)

5 Bit Width

Examples: Blank = Gates, MSI, and Octals
1G – Single Gate
8 – Octal IEEE 1149.1 (JTAG)
16 – Widebus™ (16, 18, and 20 bit)
18 – Widebus IEEE 1149.1 (JTAG)
32 – Widebus+™ (32 and 36 bit)

6 Options

Examples: Blank = No Options
2 – Series-Damping Resistor on Outputs
4 – Level Shifter
25 – 25-Ω Line Driver

7 Function

Examples: 244 – Noninverting Buffer/Driver
374 – D-Type Flip-Flop
573 – D-Type Transparent Latch
640 – Inverting Transceiver

8 Device Revision

Examples: Blank = No Revision
Letter Designator A–Z

9 Packages

Examples: D, DW – Small-Outline Integrated Circuit (SOIC)
DB, DL – Shrink Small-Outline Package (SSOP)
DBB, DGV – Thin Very Small-Outline Package (TVSOP)
DBQ – Quarter-Size Outline Package (QSOP)
DBV, DCK – Small-Outline Transistor Package (SOT)
DGG, PW – Thin Shrink Small-Outline Package (TSSOP)
FK – Leadless Ceramic Chip Carrier (LCCC)
FN – Plastic Leaded Chip Carrier (PLCC)
GB – Ceramic Pin Grid Array (CPGA)
HFP, HS, HT, HV – Ceramic Quad Flat Package (CQFP)
J, JT – Ceramic Dual-In-Line Package (CDIP)
N, NP, NT – Plastic Dual-In-Line Package (PDIP)
PAG, PAH, PCA, PCB, PM, PN, PZ – Thin Quad Flat Package (TQFP)
PH, PQ, RC – Quad Flat Package (QFP)
W, WA, WD – Ceramic Flat Package (CFP)

10 Tape and Reel

All new or changed devices in the DB and PW package types include the R designation for reeled product. Existing products designated as LE presently maintain that designation, but will be converted to R in the future.

Nomenclature Examples:
For an Existing Device – SN74LVTxxxDBLE
For a New or Changed Device – SN74LVTxxxADBR

LE – Left Embossed (valid for DB and PW packages only)
R – Standard (valid for all surface-mount packages except existing DB and PW devices)

There is no functional difference between LE and R designated products, with respect to the carrier tape, cover tape, or reels used.

LOGIC SYMBOLIZATION GUIDELINES

The logic symbolization guidelines are intended to minimize confusion concerning package symbolization on logic devices. Table 1 provides the user with a name rule and useful TI package designator information. Table 2 uses the name rule from Table 1 and applies it across all logic families.

Example: Suppose you have a 48-pin TVSOP with the symbolization VH***. Locate the 48-pin TVSOP (DGV) package in Table 1 and read across to the third column. Note that this package utilizes name rule C. Proceed to Table 2 and search down the *Name Rule C* column for VH***. The most-complete device number, SN74ALVCH16***, is located in the *Name Rule A* column.

Table 1. Name Rule Decision Tree

PACKAGE	NO. OF PINS	NAME RULE	PACKAGE DESIGNATOR
PDIP	8	A	P
	14, 16, 20	A	N
	24, 28	A	NP, NT
PLCC	28	A	FN
	44	B	FN
QSOP	16, 20, 24	B	DBQ
SOIC	1, 14, 16	B	D
	16, 20, 24, 28	B	DW
QFP	52	B	RC
	80	A	PH
	100, 132	A	PQ
SSOP	14, 16, 20, 24, 28, 30, 38	C	DB
	28, 48, 56	B	DL
TSSOP	8, 14, 16, 20, 24, 28	C	PW
	48, 56, 64	B	DGG
TVSOP	14, 16, 20, 24, 48, 56	C	DGV
	80, 100	B	DBB
TQFP	52	B	PAH
	64	B	PAG, PM
	80	B	PN
	100	B	PZ, PCA
	120	B	PCB

LOGIC SYMBOLIZATION GUIDELINES

5-Pin Single-Gate Packages (SOT-5)

Due to their small size, Microgate logic (DBV) and PicoGate Logic packages require more complex symbolization rules than other surface-mount packages.

Table 3 lists the four-character name rule for TI's Microgate logic offerings. The first character denotes the AHC sub-family, AHC1G, AHCT1G, AHCU1G, or the CBT family. The second and third characters denote device function, and the fourth character denotes a wafer fab/assembly site code for internal tracking (designated here by x).

Example: A Microgate logic device with package code A00x is an SN74AHC1G00DBV.

PicoGate Logic utilizes a three-character name rule. The first character denotes device technology, the second character denotes device function, and the third character denotes a wafer fab/assembly site code for internal tracking (designated here by x) (see Table 4).

Example: A PicoGate Logic device with package code HAx is an SN74HC1G00DCK.

Table 3. Microgate Logic (DBV) Package Symbolization Codes

DEVICE NAME	CODE
SN74AHC1G**	A**x
SN74AHCT1G**	B**x
SN74AHCU1G**	U**x
SN74CBT1G**	S**x

** Denotes the two-number function of the device (00, 04, 10, etc.). The 125 function is shown as 25.

Table 4. PicoGate Logic (DCK) Package Symbolization Codes

Package Breakout by Levels

LEVEL 1	
PACKAGE	NO. OF PINS
D	8, 14, 16
DB	14, 16, 20, 24
DBQ	16, 20, 24
DBV	5
DGV	14, 16
DL	28, 48, 56
DW	16, 20, 24, 28
FN	20, 28
N	14, 16, 20
NS	14, 16, 20, 24
NT	24, 28
PW	8, 14, 16

LEVEL 2	
PACKAGE	NO. OF PINS
DBB	80, 100
DGG	64
DGV	20, 24, 48, 56
FN	44, 68, 84
PAG	64
PAH	52
PCA	100
PCB	120
PN	80
PW	20, 24
PZ	100
RC	52

LEVEL 3	
PACKAGE	NO. OF PINS
DGG	48, 56
PH	80
PPM	208
PQ	132

LEVEL 4	
PACKAGE	NO. OF PINS
PM	64

Level 1: Not moisture sensitive, dry pack not required
Levels 2–4: Moisture sensitive, dry pack required

Moisture-Sensitivity Levels (Per QSS 009-138, Rev D)

LEVEL	FLOOR LIFE		SOAK REQUIREMENTS	
	CONDITIONS	TIME (hours)	CONDITIONS	TIME (hours)
1	≤ 30°C/90% RH	Unlimited	85°C/85% RH	168
2	≤ 30°C/60% RH	1 year	85°C/60% RH	168
				X + Y = Z†
3	≤ 30°C/60% RH	168	30°C/60% RH	24 + 168 = 192
4	≤ 30°C/60% RH	72	30°C/60% RH	24 + 72 = 96
5	≤ 30°C/60% RH	24	30°C/60% RH	24 + 24 = 48
6	≤ 30°C/60% RH	6	30°C/60% RH	0 + 6 = 6

RH = Relative humidity
† X + Y = Z, where:
X = Default value of time between bake and bag. If the actual time exceeds this value, use the actual time and adjust the soak time (Z). For levels 3–6, X may be standardized at 24 hours so long as the actual time does not exceed this value.
Y = Floor life of package after it is removed from dry-pack bag
Z = Total soak time for the evaluation

LOGIC OVERVIEW

SECTION 1
LOGIC OVERVIEW

CONTENTS

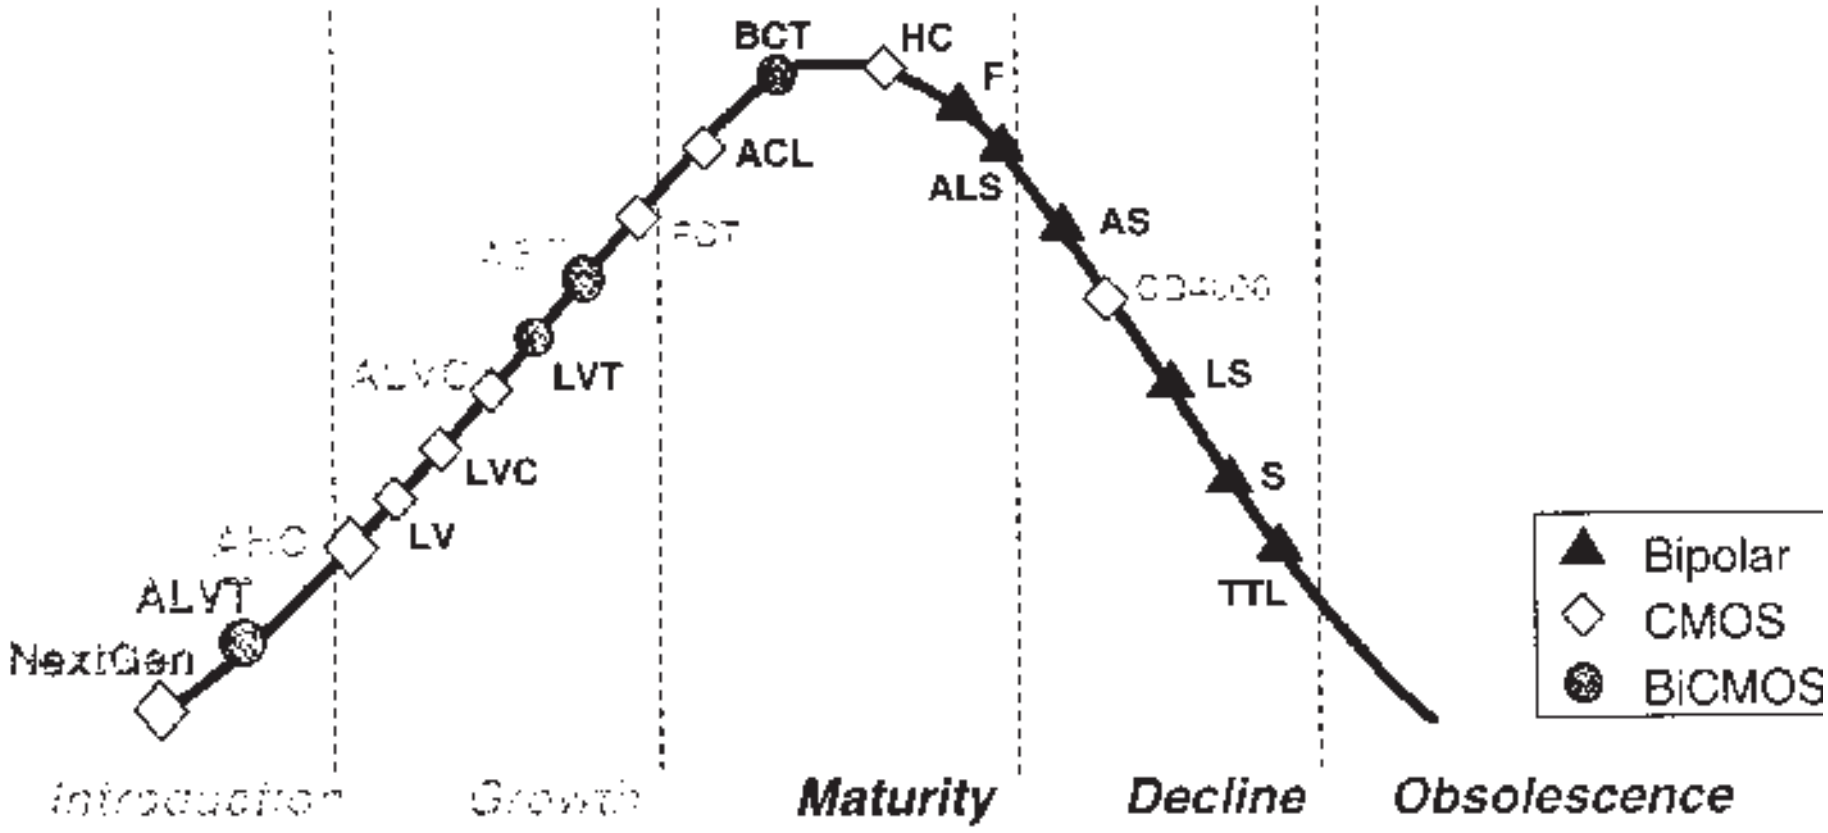
TEXAS INSTRUMENTS

1998 Logic Priorities

- AHC/AHCT Conversion From HCMOS
- Continue Success of ABT Over FCT
- Continue Low-Voltage-Logic Dominance

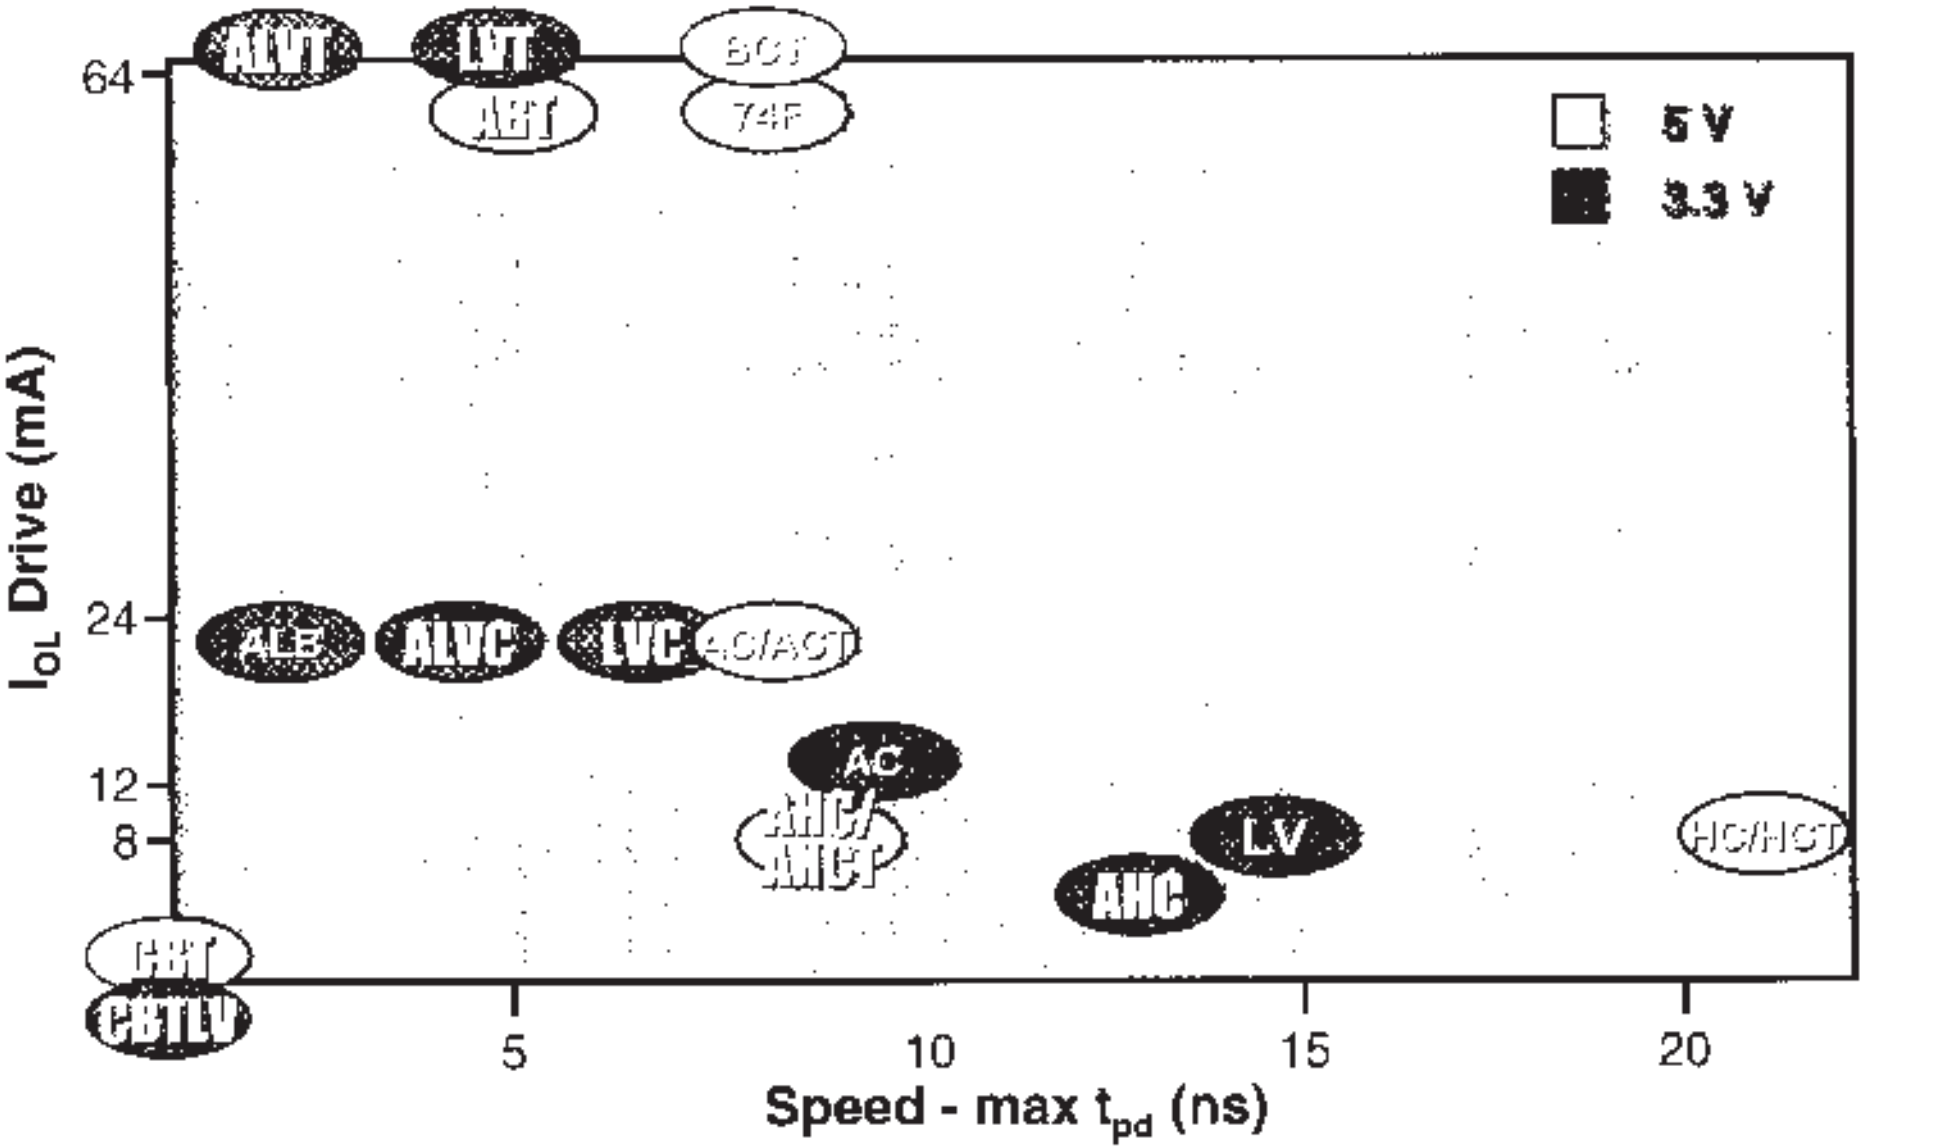
One-Stop Logic Shop!

Product Life Cycle



- TI remains committed to be the last supplier in the older families.
- Investment levels for new products are at an all time high while end equipment requirements are accelerating new product introduction.

Family Performance Positioning



Standard Linear & Logic

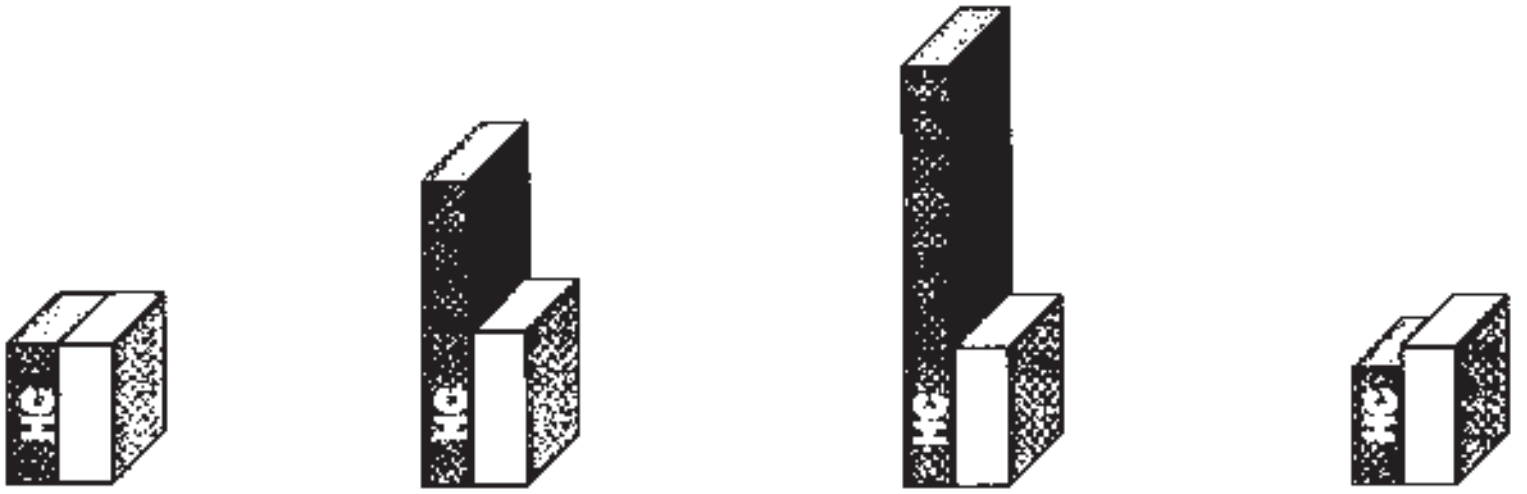
HCMOS Market Analysis

- **Data Indicates DESIGNERS prefer HCMOS due to:**
  - Low Noise
  - Low Power
  - Low Price
- **Requested Improvements**
  - Improve Output Current
  - Improve Power Consumption
  - Improve Package Offering
  - 5V Signal Tolerance
  - Better Availability
  - Higher Speed

Standard Linear & Logic

AHC/AHCT: Advanced HCMOS

A Reliable and Effortless Migration Path for HCMOS Users



Ground Bounce (V_{OLP}) | **Static Power Consumption** | **Propagation Delay** | **Drive - I_{OL}**

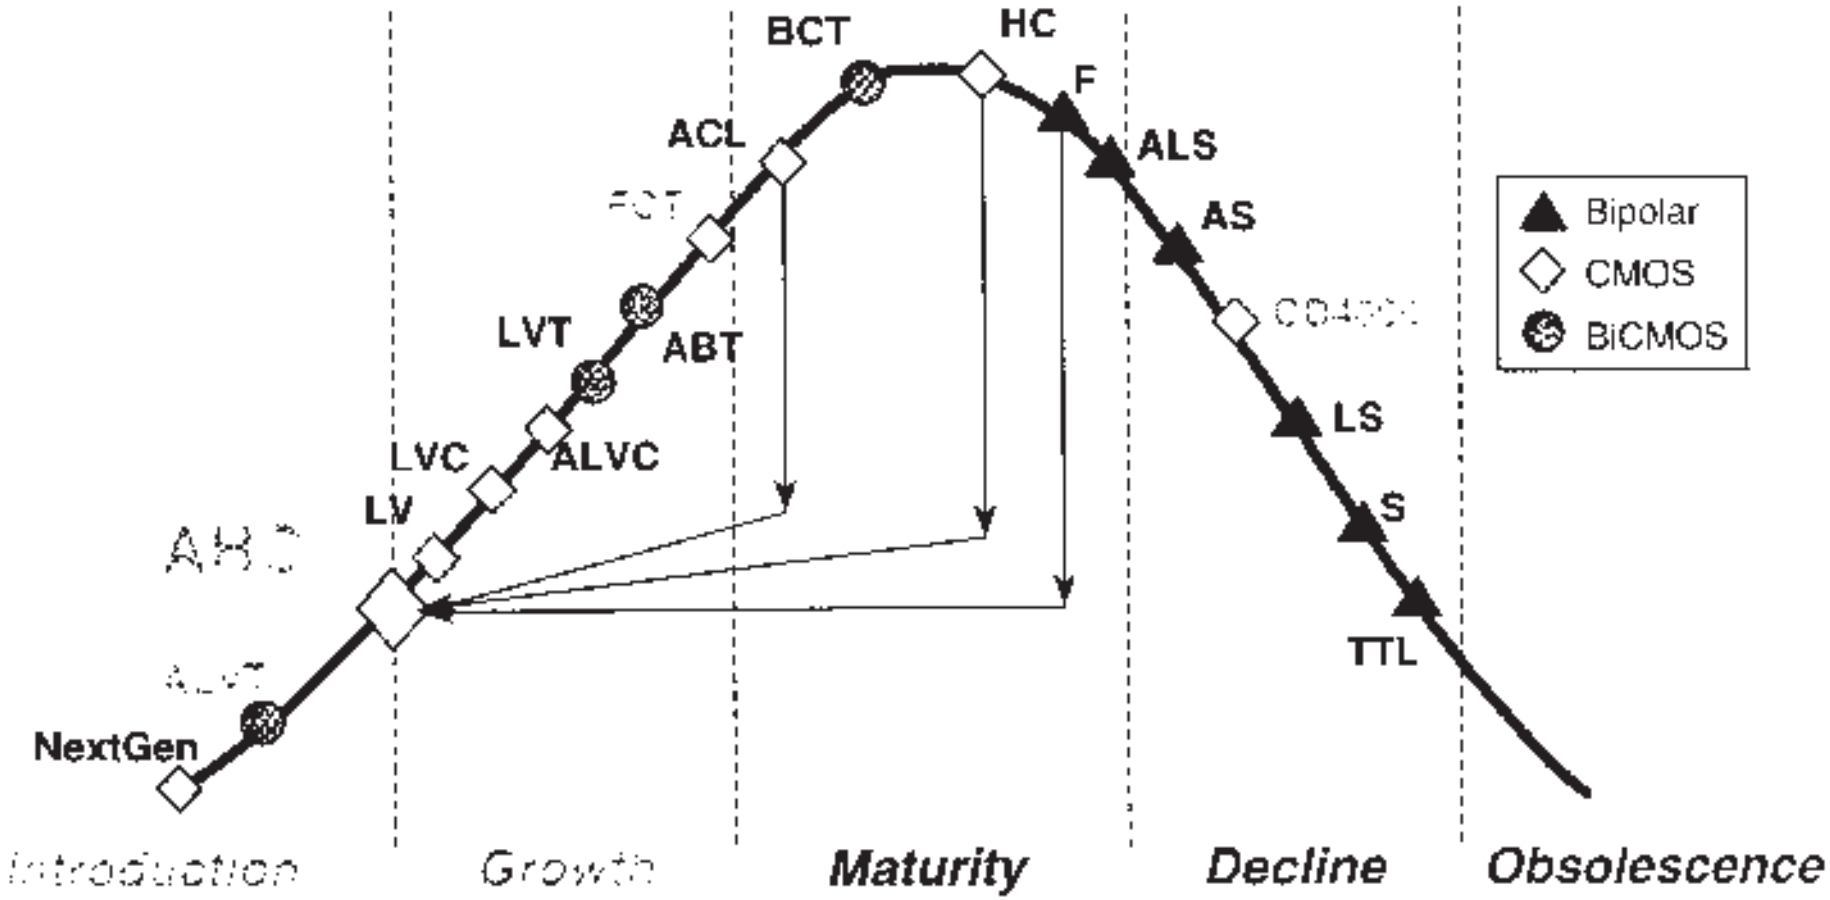
at the current market price as hcmos!

Plus:

- Output Edge Control (OEC™)
- Improved Package Offering: TVSOP, TSSOP, SSOP, SOIC, PDIP
- Widebus™ (16-Bit), Single gate (Single-bit) options available
- 5V Input Tolerance (AHC specified in data sheet at both 5V and 3.3V. Input diode to V_{CC} removed!)
- Highest availability of any logic family on the market! - 5 Worldwide Sources
- TI is the #1 Worldwide Logic Source (1996 - Doubled CMOS and fine pitch package capacity)

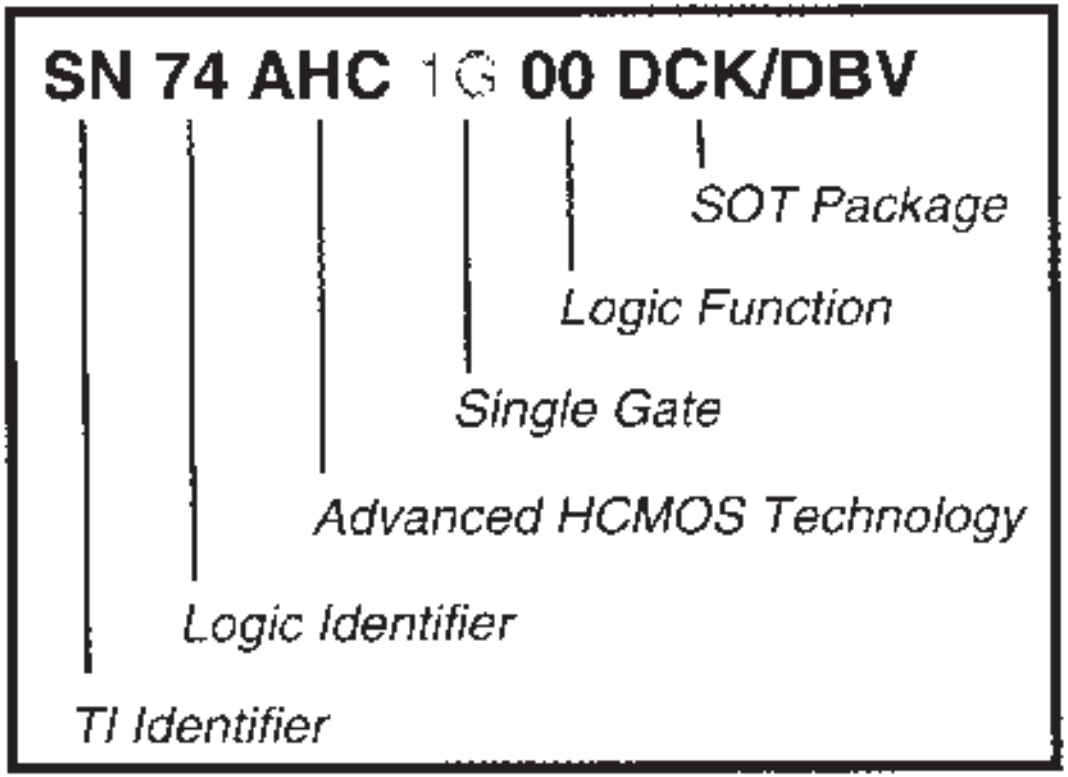
Standard Linear & Logic

A Reliable and Effortless Migration Path for HCMOS Users



For HCMOS, AC/ACT, and 74F upgrades, AHC is the family of choice!

AHC/AHCT Single-Gate Logic



- Simplifies circuit routing
- ASIC modification
- Industry's smallest logic package reduces board space requirement
- Alternate source by Philips
- CMOS Compatible (AHC) and TTL Compatible (AHCT) versions
- Compatible with Toshiba's TC7SH/SETxx series and Fairchild's NC7SH/NC7ST series
- Samples available: now

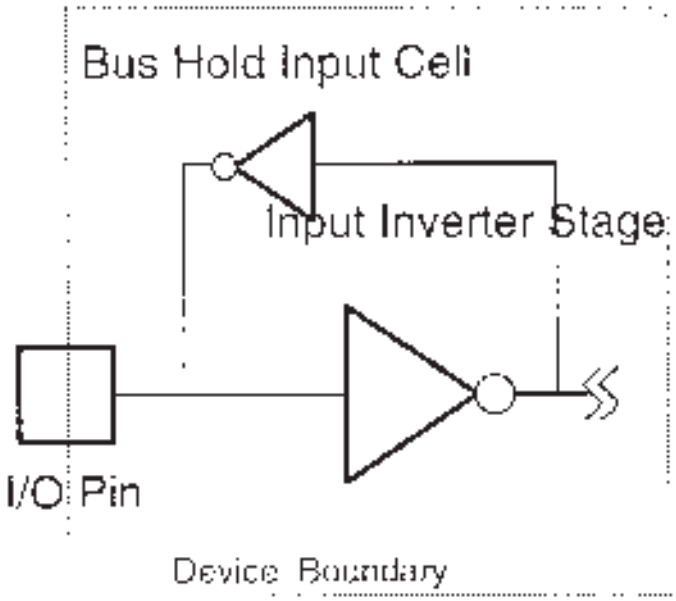
Standard Linear & Logic

Bus-Hold Input Characteristics



Bus hold input cell replaces pullup resistor

- Holds the last known state of the input
- $I_{I(HOLD)}$ ± 75 µA min holding current at 0.8 and 2V
- Bus hold current does NOT load down the driving output at valid logic levels
- Eliminates the need for external resistors on unused or floating input/output pins
- The "H" in the device name indicates bus-hold

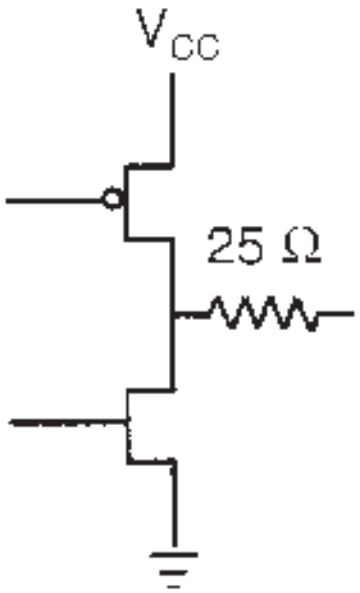
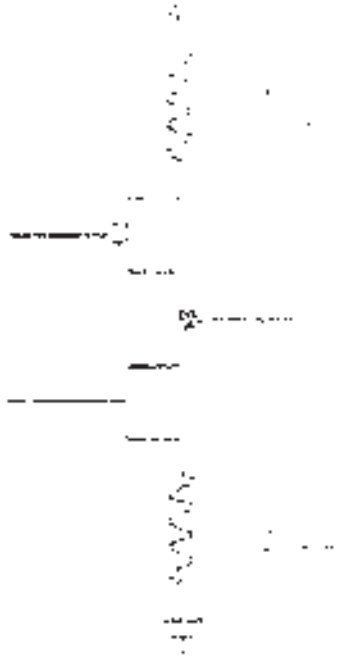
Damping Resistors





TI's Series-Damping Resistor Option

- Limits the current thereby reducing noise from undershoot/overshoot
- Helps in line termination (reduces ringing/line reflection to improve signal quality)

Competitor's Balanced Drive

e.g.: 'ABT2245
'ABT162245

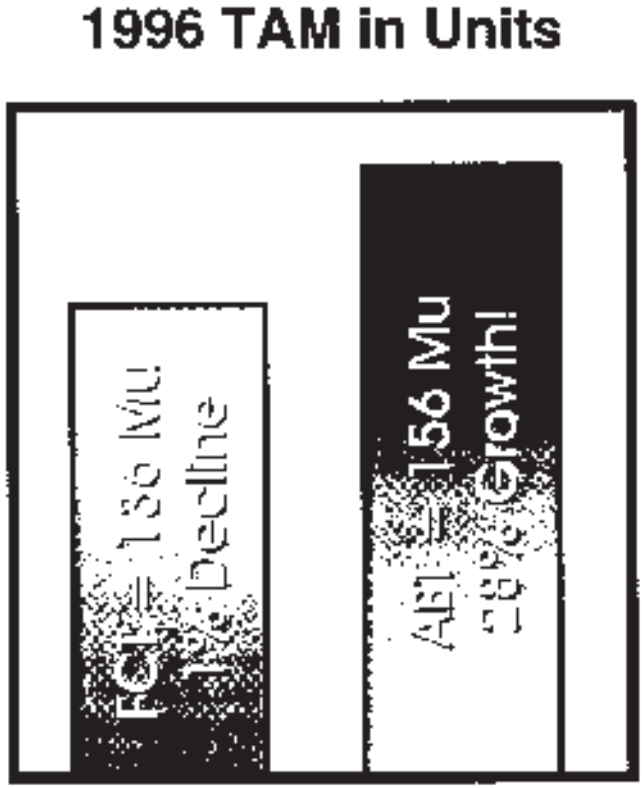
Extra "2" in device name indicates damping resistor

Standard Linear & Logic

Continued Logic Leadership
ABT vs. FCT

ABT is the undisputed WINNER in the ABT/FCT battle

- FCT TAM at $147M
- ABT TAM at $200M
- TI dominates the ABT market: 80% market share



ABT is the Clear Winner!

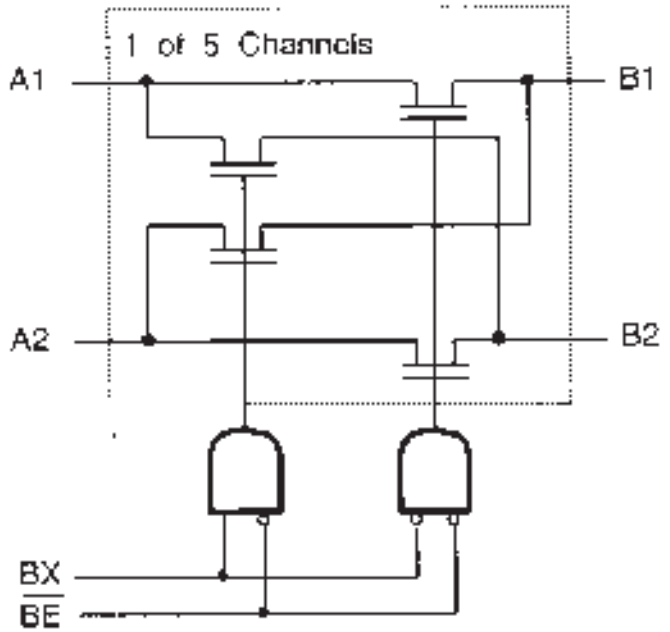
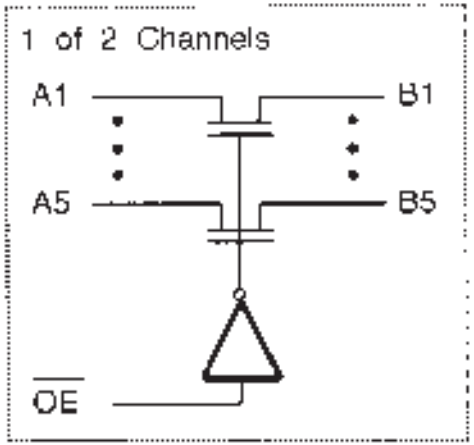
CBT Bus-Exchange Switches

CBT3383 BUS EXCHANGER



'CBT3384A BUS SWITCH



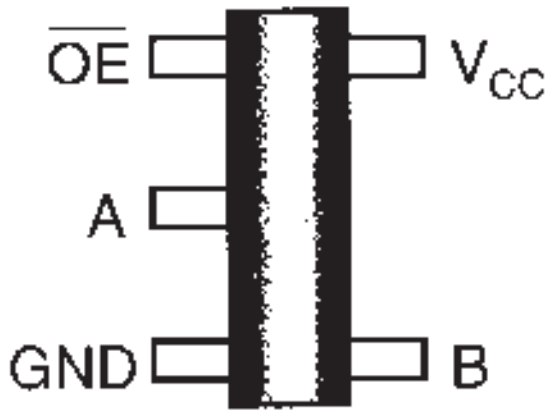
- Simple FET Switches
- Functionally Equivalent To: QS3383 and QS3384
- Industry Standard Pinouts ('244, '245)
- Widebus™ Functions Available
- Fine Pitch Packaging Options (SOIC, SSOP, TSSOP, Widebus, Shrink Widebus™)
- Octals and Widebus available NOW!

Standard Linear & Logic

CBT Single-Gate Logic

SN 74 CBT 1G 00 DBV/DCK

- *SOT Package*
- *Logic Function*
- *Single Gate*
- *Cross Bar Technology*
- *Logic Identifier*
- *TI Identifier*



- Simplifies circuit routing
- 250 ps propagation delay
- Low on-state resistance (5Ω)
- Ideal for control signal isolation

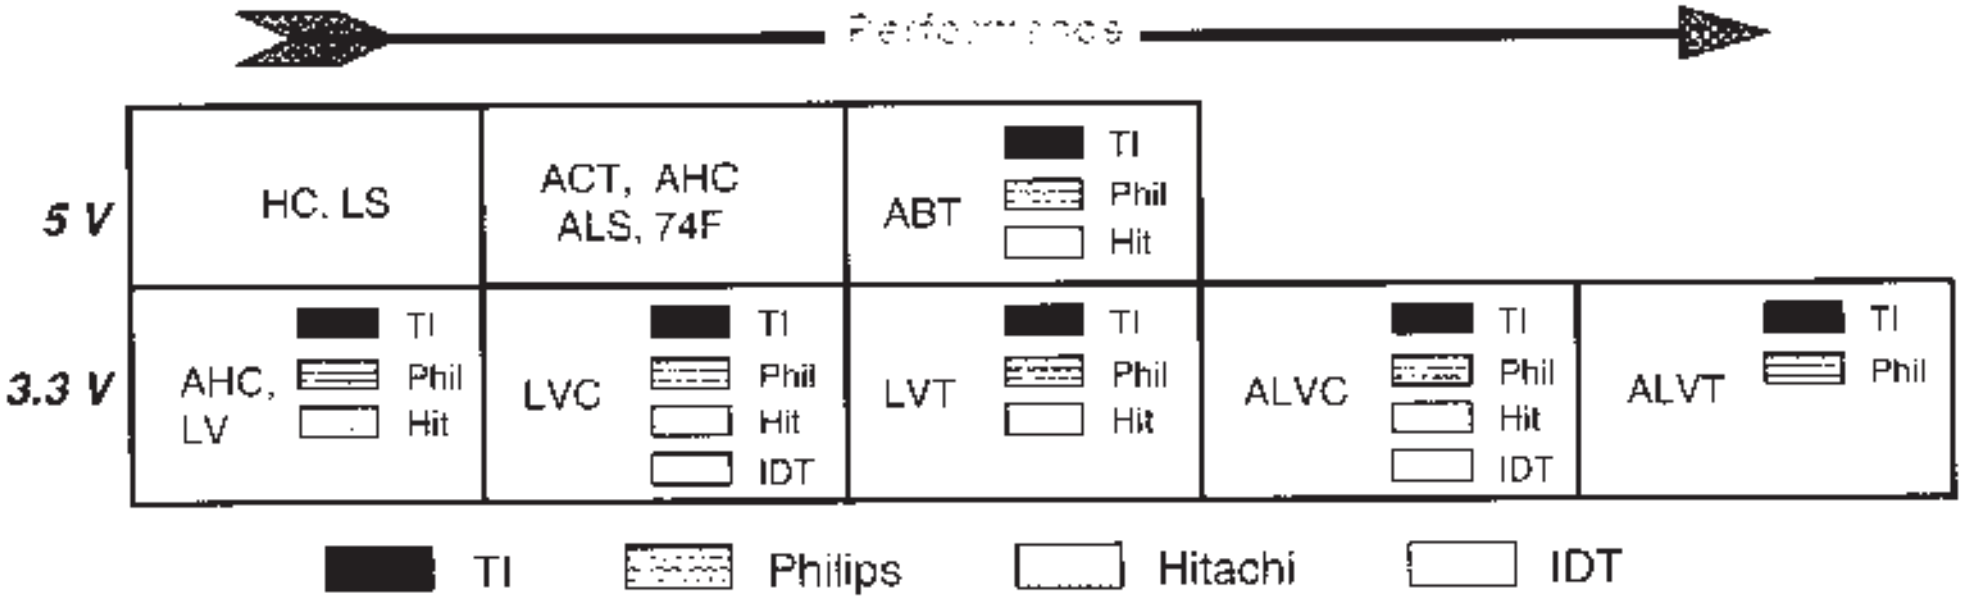
CBT/CBTLV Product Offering

- Multiple package offerings
- CBTDs with integrated V_{CC} diode for 5V-to-3.3V level translation
- CBTSs with integrated Schottky diodes on inputs/outputs to clamp negative undershoots
- Broad product offering
- 1st to market with CBTLV family

Complete Low-Voltage Market Coverage and Standardization



AHC
- ✔8.5 ns speed(5 V)
- ✔13.5 ns speed(3.3 V)
- ✔-8/8 mA drive (5 V)
- ✔-4/4 mA drive(3.3 V)
- ✔5 V or 3.3 V Vcc
- ✔5 V input tolerant
- ✔4 WW sources

LVC
- ✔6.5 ns speed
- ✔-24/24 mA drive
- ✔Ultra-low (20 µA) standby power
- ✔3 WW sources
- ✔Bus hold
- ✔5 V tolerant
- ✔Gate functions
- ✔Live insertion

LVT
- ✔4 ns speed
- ✔-32/64 mA drive
- ✔Low (90 µA) standby power
- ✔3 WW sources
- ✔Bus hold
- ✔5 V tolerant
- ✔Live insertion

ALVC
- ✔3 ns speed
- ✔-24/24 mA drive
- ✔Ultra-low (40 µA) standby power
- ✔3 WW sources
- ✔Bus hold

ALVT
- ✔-32/64 mA drive
- ✔2 WW sources
- ✔Bus hold
- ✔5 V tolerant
- ✔Live insertion

Standard Linear & Logic

Advanced Low-Voltage CMOS - ALVC

Circuit Features

- Bus hold ($I_{I(HOLD)}$)
- Drive capability
  (-24/24 mA @ 3.3 V V_{CC})
  (-6 /12 mA @ 2.5 V V_{CC})
- Low noise
- Damping resistor options
- ESD protection
- Spec'd for 3.3 V and 2.5 V operation

Advantages

- Performance leadership product
- Marketing and applications support
  - SPICE models
- Internal and external second sources
- Wide product portfolio
- Specialized memory interface functions available for SDRAMs

Standard Linear & Logic

Low-Voltage BiCMOS - LVT

Circuit Features

- Mixed mode 5 V TTL compatible $V_{I/O}$ 7 V max
- Live insertion (I_{OFF})
- Bus hold ($I_{I(HOLD)}$)
- Drive capability -32/64 mA
- Low noise
- Power on demand
- Damping resistor options
- ESD protection

Advantages

- Largest selling low voltage
- Marketing and applications support
- SPICE models
- Internal and external second sources
- Wide product portfolio

Low-Voltage CMOS - LVC

Circuit Features

- 5 V tolerant
- Live insertion (I_{OFF})
- Bus hold option($I_{I(HOLD)}$)
- Drive capability (-24/24 mA at 3.3 V V_{CC})
- Low noise
- Damping resistor options
- ESD protection

Advantages

- Price/performance
- Second sources
- Broad product offering
- Marketing and applications support
- SPICE models
- Gates
- No bus-hold/damping resistors with competitor (LCX)

Standard Linear & Logic

Stub Series-Terminated Logic - SSTL

Characteristics:

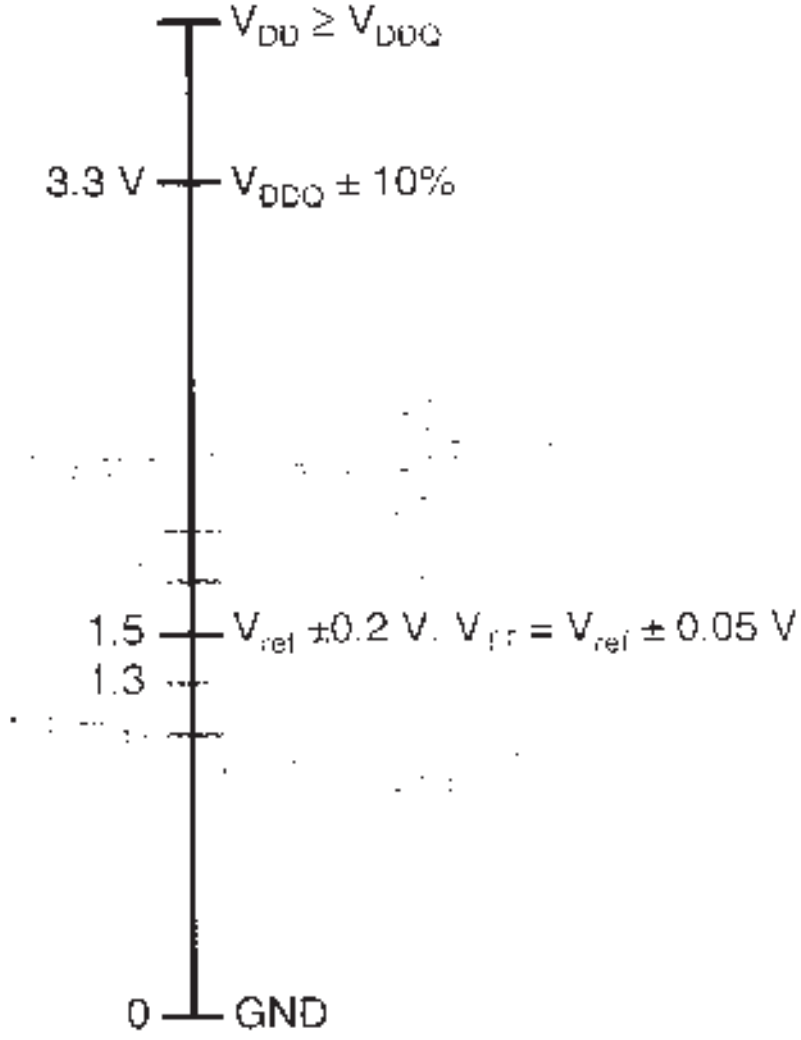
- Supports SSTL_3 and LVTTL signal inputs and outputs
- Input threshold = $V_{REF} \pm 0.2$ $V_{REF} = 1.5V$
- Drive = ± 20 mA
- Interfaces with next generation SDRAM

Benefits:

- Allows higher system clock rate
  - point-to-point communication speeds of 200 MHz

Considering for next device:

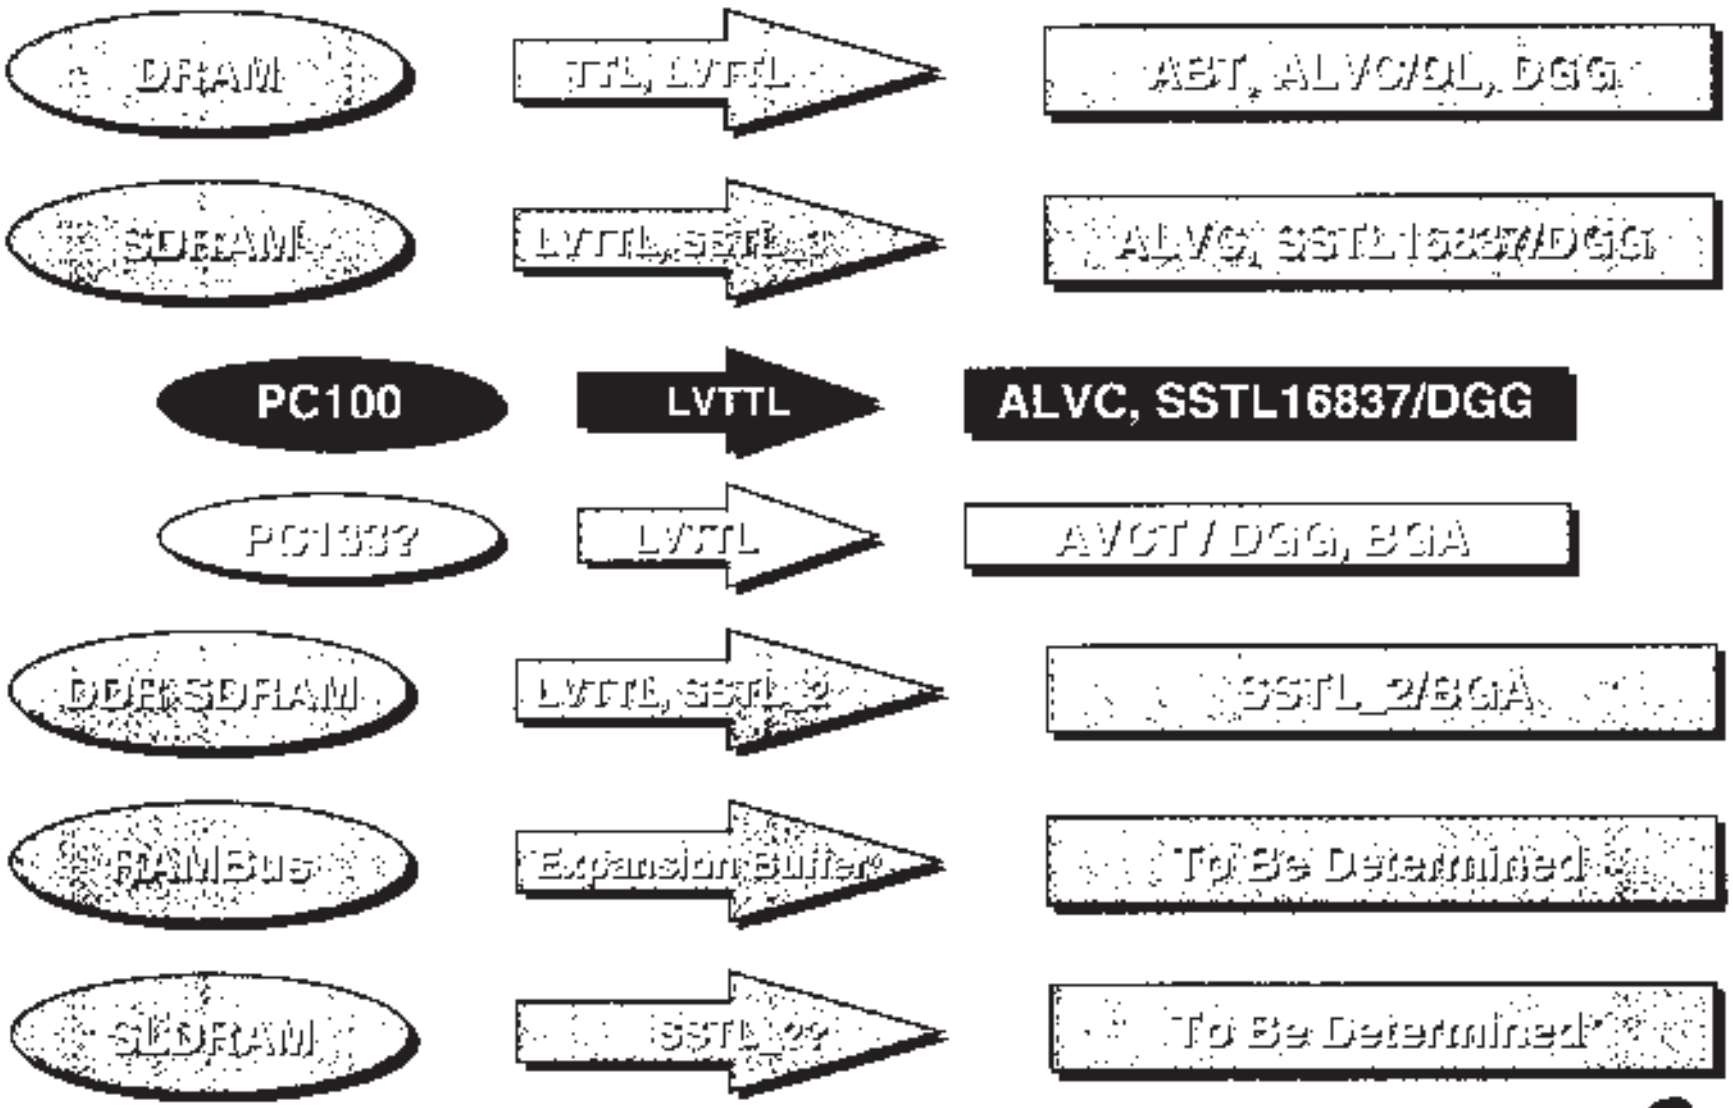
- SSTL Universal Bus Transceivers for data bus
- SSTL registered data multiplexer/exchanger



SSTL_3

Standard Linear & Logic

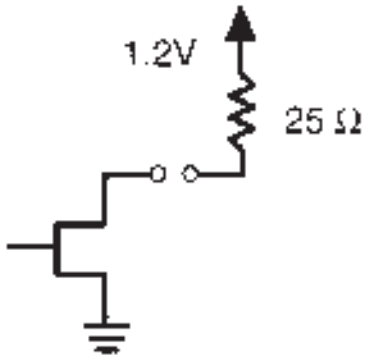
Memory Roadmap with Compatible Logic Families



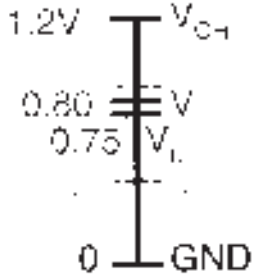
Standard Linear & Logic

What Is GTL?

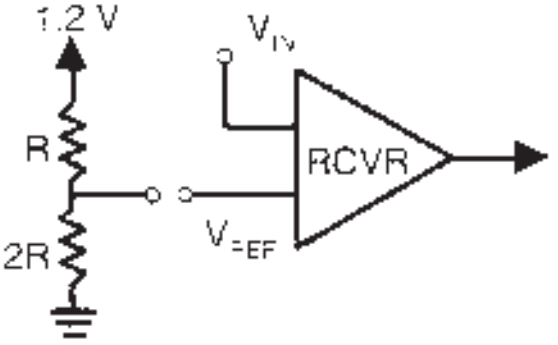
- Driver is an open drain n-channel CMOS transistor



- Reduced voltage swing reduces power and allows integration into VLSI CMOS



- Receiver stage is a differential input with external V_{REF} set at 0.8V. V_{REF} is derived from simple R/2R voltage divider of 1.2V pull-up.



Advantages of GTL

Noise: External V_{REF} provides common-mode noise immunity (derived from 1.2V pull-up).

Low signal amplitude reduces EMI

Speed: Absence of Reflections Allows Higher System Clock Rate
- Very high speed point-to-point communication (100+ MHz)
- Backplane speeds over 60 MHz

Power: High speed, low power backplane alternative to BTL or ECL

Power Comparison (160 active I/Os)

Technology	Power (watts)	Termination
ECL 10K	20	25 Ω to 3.0V
BTL	11	16.5 Ω to 2.0V
GTL	1.5	50 Ω to 1.2V

Cost: GTL transceivers are less than half the cost per bit as BTL drivers of comparable speeds.

DEVICE SELECTION GUIDE

SECTION 4
DEVICE SELECTION GUIDE

CONTENTS

Refer to the following for MIL column entries:

military package description and availability

CDIP (ceramic dual-in-line package)
J = 14/16/20 pins
JT = 24/28 pins

CFP (ceramic flat package)
WA = 14 pins (small outline)
W = 14/16/20 pins
WD = 48/56 pins

CPGA (ceramic pin grid array)
GB= 68/84/120 pins

CQFP (ceramic quad flat package)
HV = 68 pins
HT = 84 pins
HS = 100 pins
HFP= 132 pins

LCCC (leadless ceramic chip carrier)
FK = 20/28 pins

schedule

★ = Please see the corresponding device data sheet for correct military nomenclature or visit http://www.ti.com/sc/docs/military for TI military product information.

ABT
Advanced BiCMOS Technology

The ABT family is TI's second-generation family of BiCMOS bus-interface products. It is manufactured using the latest 0.8-μ BiCMOS process and provides high drive up to 64 mA and propagation delays below the 5-ns range, while maintaining very low power consumption. ABT products are well suited for live-insertion applications with an I_{off} specification of 0.1 mA.

To reduce transmission-line effects, the ABT family has series-damping resistor options. Furthermore, there are special ABT parts that provide extremely high-current drive (180 mA) to transmit down to 25-Ω transmission lines. Advanced bus functions, such as universal bus transceivers (UBT™) emulate a wide variety of bus-interface functions. Multiplexing options for memory interleaving and bus upsizing or downsizing also are provided.

The ABT devices can be purchased in octal, Widebus™, or Widebus+™. The Widebus and Widebus+ packages feature higher performance with reduced noise and flow-through pinout for easier board layout. In addition, the Widebus+ devices have bus-hold circuitry on the inputs to eliminate the need for external pullup resistors for floating inputs.

For ABT data sheets, see the 1997 *ABT Logic Advanced BiCMOS Technology Data Book*, literature number SCBD002C.

ABTE/ETL
Advanced BiCMOS Technology/ Enhanced Transceiver Logic

ABTE has wider noise margins and is backward compatible with existing TTL logic. ABTE devices support the VME64-ETL specification with tight tolerances on skew and transition times. ABTE is manufactured using the latest 0.8-μ BiCMOS process by providing high drive up to 90 mA. Other features include a bias pin and internal pullup resistors on control pins for maximum live-insertion protection. Bus-hold circuitry eliminates external pullup resistors on the inputs and series-damping resistors on the outputs to damp reflections.

For ABTE/ETL data sheets, see the 1997 *GTL, BTL, and ETL Logic Data Book*, literature number SCED004.

AC/ACT
Advanced CMOS Logic

The ACL family of devices is manufactured in 1-μ CMOS and has more than 70 functions, including gates, flip-flops, drivers, counters, and transceivers. The ACL family is a reliable, low-power logic family with 24-mA output drive.

Included in the family are standard end-pin products and center-pin V_{CC} and ground-configuration products with output-edge control (OEC™) circuitry. The OEC™ circuitry, available only with the center-pin products, helps reduce simultaneous switching noise associated with high-speed logic. Included in the center-pin products are 16-, 18-, and 20-bit bus-interface functions packaged in 48- and 56-pin shrink small-outline packages (SSOP) and thin shrink small-outline packages (TSSOP). These packages allow the designer to double functionality in the same circuit board area or reduce the circuit board area by one-half.

AC devices offer CMOS-compatible inputs and ACT devices offer TTL-compatible inputs.

For AC/ACT data sheets, see the 1997 *AC/ACT CMOS Logic Data Book*, literature number SCAD001D.

AHC/AHCT
Advanced High-Speed CMOS Logic

The AHC/AHCT logic family provides a natural migration for HCMOS users who need more speed for low-power, low-noise, and low-drive applications. The AHC logic family consists of basic gates, medium-scale integrated circuits, octal and 16-bit Widebus functions fabricated using the EPIC1-S process that produces high performance at low cost. In addition, TI offers a new single-gate solution, designated with 1G in the device name.

Performance characteristics of the AHC family are:

- Speed – With typical propagation delays of 5.2 ns (octals), which is about three times faster than HC devices, AHC devices are the quick and quiet solution for higher-speed operation.
- Low noise – The AHC family allows designers to combine the low-noise characteristics of HCMOS devices with today's performance levels without the overshoot/undershoot problems typical of higher-drive devices usually required to get AHC speeds.
- Low power – The AHC family, by using CMOS technology, exhibits low power consumption (40-μA maximum static current, half that of HCMOS).
- Drive – Output-drive current is ±8 mA at 5-V V_{CC} and ±4 mA at 3.3-V V_{CC}.
- Packaging – AHC devices are available in D and DW (SOIC), DB (SSOP), N (PDIP), PW (TSSOP), DGV (TVSOP), and DCK and DBV (5-pin SOT) packages. Selected AHC devices are available in military versions (SN54AHCXX).

Using TI products offers several business advantages:

- Competitive advantage – AHC and VHC devices have equivalent specifications; therefore, AHC devices are drop-in replaceable. With TI's production capacity, delivery performance, and competitive prices, AHC devices are among the most economical, easy-to-use, and easy-to-get logic products.
- Alternate source – TI has arrangements for one or more alternate sources for AHC/AHCT devices.

For AHC/AHCT data sheets, see the 1997 *AHC/AHCT Logic Advanced High-Speed CMOS Data Book*, literature number SCLD003A.

ALB
Advanced Low-Voltage BiCMOS

The specially designed 3.3-V ALB family uses the latest 0.6-µ BiCMOS technology for bus-interface functions. In addition, ALB provides 25-mA drive at 3.3 V with maximum propagation delays of 2.2 ns, making it TI's fastest logic family to date. The inputs have clamping diodes to eliminate overshoot and undershoot.

The ALB family is currently available in a limited number of functions with Widebus™ and Shrink Widebus™ footprints with advanced packaging options such as shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), and planned for thin very small-outline package (TVSOP).

ALS
Advanced Low-Power Schottky Logic

The ALS family provides a full spectrum of over 130 bipolar logic functions.

This family, combined with the AS family, can be used to optimize systems through performance budgeting. By using AS in speed-critical paths and ALS where speed is less critical, designers can optimize speed and power performance.

The ALS family includes gates, flip-flops, counters, drivers, transceivers, registered transceivers, readback latches, clock drivers, register files, and multiplexers.

For ALS data sheets, see the 1995 *ALS/AS Logic Data Book*, literature number SDAD001C.

ALVC
Advanced Low-Voltage CMOS Technology

One of the highest-performance 3.3-V bus-interface families is the ALVC family. These specially designed 3-V products are processed in 0.6-μ CMOS technology, giving typical propagation delays of less than 3 ns, along with current drive of 24 mA and static power consumption of 40 μA for bus-interface functions. The ALVC devices have bus-hold cells on inputs to eliminate the need for external pullup resistors for floating inputs. With over 50 Widebus™ and Widebus™ with series-damping resistors already released and with gates/octals on the roadmap, ALVC is quickly becoming the industry standard for all 3.3-V logic applications. The family also features innovative functions that make it ideal for memory interleaving, multiplexing, and interfacing to SDRAMs.

The ALVC family is offered in the Widebus™ footprints with all of the advanced packaging such as shrink small-outline package (SSOP) and thin shrink small-outline package (TSSOP).

For ALVC data sheets, see the 1998 *ALVC Advanced Low-Voltage CMOS Data Book*, literature number SCED006.

ALVT
Advanced Low-Voltage BiCMOS Technology

ALVT is the highest performance 3.3-V TI bus-interface to date. These specially designed 5-V tolerant, 3.3-V products use the latest 0.6-μ BiCMOS technology for bus-interface functions. ALVT provides superior performance, delivering 2.4-ns propagation delays, current drive of 64 mA, and static power consumption of 90 μA. The ALVT devices have bus-hold cells on inputs to eliminate the need for external pullup resistors for floating inputs. The ALVT family also provides innovative features, such as series-damping resistors to reduce transmission-line effects, and power-up 3-state to eliminate bus-current loading. ALVT products also are well suited for live-insertion applications with an I_{off} of 0.1 mA. Looking to the future, the ALVT family is already specified for 2.5-V operation.

The ALVT family is planned in a limited number of functions with Widebus™ and Shrink Widebus™ footprints with advanced packaging options such as shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), and thin very small-outline package (TVSOP).

AS
Advanced Schottky Logic

The AS family of high-performance bipolar logic includes over 90 functions that offer high drive capabilities.

This family, combined with the ALS family, can be used to optimize system speed and power through performance budgeting. By using AS in speed-critical paths and ALS where speed is less critical, designers can optimize speed and power performance.

The AS family includes gates, flip-flops, counters, drivers, transceivers, registered transceivers, readback latches, clock drivers, register files, and multiplexers.

For AS data sheets, see the 1995 *ALS/AS Logic Data Book*, literature number SDAD001C.

BCT
BiCMOS Technology

BCT is a family of 8-, 9-, and 10-bit drivers, latches, transceivers, and registered transceivers. Designed specifically for bus-interface applications, BCT offers TTL I/O with high speeds, 64-mA output drive, and very low power in the disabled mode. Over 50 BCT functions are in production now.

A family of fast, high-drive bus-interface functions that provides the incident-wave switching required by large backplane applications has been incorporated into the BCT offering. Designed specifically to ensure incident-wave switching down to 25 Ω, the devices in the BiCMOS low-impedance driver family can maximize the speed and reliability of heavily loaded systems. Each device in this series delivers 188 mA of I_{OL} drive current.

Also included in our BCT family is a series of memory drivers. These devices incorporate a series-damping resistor to reduce overshoot and undershoot that can occur in memory-driving applications.

For BCT data sheets, see the 1994 *BCT BiCMOS Bus-Interface Logic Data Book*, literature number SCBD001B.

64BCT
64-Series BiCMOS Technology

The 64BCT family offers all the features found in TI's standard BCT family. In addition, the family is characterized for operation from –40°C to 85°C and incorporates circuitry to protect the device in live-insertion applications.

For 64BCT data sheets, see the 1994 *BCT BiCMOS Bus-Interface Logic Data Book*, literature number SCBD001B.

BTA
Bus-Termination Arrays

The BTA family from TI offers a space-saving, efficient, and effective solution to bus-termination requirements. In high-speed digital systems with long transmission lines, reflecting waves on the line can cause voltage undershoots and overshoots that lead to malfunctions at the driven input. A BTA is a series of diodes that clamps a signal on a bus or any other signal trace using high-frequency logic to eliminate overshoot and undershoot problems.

For BTA data sheets, see the 1994 *F Logic Data Book*, literature number SDFD001B, or contact the Product Information Center at (972) 644-5580.

BTL/FB+
Backplane Transceiver Logic

The FB series devices are used for high-speed bus applications and are fully compatible with the IEEE 1194.1-1991 (BTL) and IEEE 896-1991 (Futurebus+) standards. These transceivers are available in 7-, 8-, 9-, and 18-bit versions with TTL and BTL translation in performance below 5 ns. Other features include drive up to 100 mA and bias pins for live-insertion applications.

For BTL/FB+ data sheets, see the 1997 *GTL, BTL, and ETL Logic Data Book*, literature number SCED004.

CBT
Crossbar Technology

In today's computing market, power and speed are two of the main concerns. CBT can address both of these issues in bus-interface applications. CBT enables a bus-interface device to function as a very fast bus switch, effectively isolating buses when the switch is open and offering very little propagation delay when the switch is closed. These devices can function as high-speed bus interfaces between computer-system components such as the central processing unit (CPU) and memory. CBT devices also can be used as 5-V to 3.3-V translators, allowing designers to mix 5-V or 3.3-V components in the same system.

The CBT devices are available in advanced packaging such as shrink small-outline packages (SSOP), thin shrink small-outline packages (TSSOP), and thin very small-outline packages (TVSOP) for reduced board area.

For CBT data sheets, see the 1998 *CBT (5-V) and CBTLV (3.3-V) Bus Switches Data Book*, literature number SCDD001B.

CBTLV
Low-Voltage Crossbar Technology

TI has developed the SN74CBTLV family of 3.3-V bus switches to complement its existing SN74CBT family of 5-V bus switches. TI is the first to offer these devices designed for 3.3-V in its continuing drive to provide low-voltage solutions.

CBTLV devices can be used in multiprocessor systems as fast bus connections, bus-exchange switches for crossbar systems, ping-pong memory connections, or bus-byte swapping. They also can be used to replace relays, improving connect/disconnect speed and eliminating relay-reliability problems. The CBTLV family, designed to operate at 3.3 V, furthers the goal of an integrated system operating with LVTTL voltages.

The CBTLV devices are available in industry-leading packaging options such as the shrink small-outline package (SSOP), thin small-outline package (TSSOP), and thin very small-outline package (TVSOP) for reduced board area.

For CBTLV data sheets, see the 1998 *CBT (5-V) and CBTLV (3.3-V) Bus Switches Data Book*, literature number SCDD001B.

74F
Fast Logic

74F logic is a general-purpose family of high-speed advanced bipolar logic. TI provides over 60 functions, including gates, buffers/drivers, bus transceivers, flip-flops, latches, counters, multiplexers, and demultiplexers in the 74F logic family.

For 74F data sheets, see the 1994 *F Logic Data Book*, literature number SDFD001B.

FIFO
First-In, First-Out Memories

TI has an extended product offering of Advanced CMOS (ACT), Advanced BiCMOS (ABT), and Advanced Low-Voltage CMOS (ALVC) FIFOs. The FIFO product family includes clocked unidirectional and bidirectional FIFOs offered in 64-bit to 2K memory depths and 1-bit to 36-bit widths.

TI's application-specific FIFOs are specially designed for use in telecommunications, DSP, internetworking systems, and high-bandwidth computing. These devices include features such as parity generate and check, retransmit, bus matching, byte swapping, bypass mode, and microprocessor-like control interface.

Application-specific FIFOs, in addition to TI's Widebus™ FIFO products, offer space-saving surface-mount packaging and multiple-speed sorts for ease of design.

GTL
Gunning-Transceiver-Logic Technology

GTL technology is a new reduced-voltage switching standard that provides high-speed, point-to-point communications with low power dissipation. TI offers GTL/TTL translators to interface with the TTL-based subsystems. This enables designers to use the GTL switching standards for speed-sensitive subsystems and to use the translators to interface with the rest of the system.

GTL devices have innovative circuitry, such as bus hold on the inputs to eliminate the need for external pullup resistors for floating inputs, which reduces power, cost, and board-layout time. Output edge-rate control (OEC™) is offered on the outputs to reduce electromagnetic interference (EMI) caused by the high frequencies of GTL.

Industry-leading packaging such as the shrink small-outline package (SSOP) and thin shrink small-outline package (TSSOP) is available for higher performance and reduced board space.

For GTL data sheets, see the 1997 *GTL, BTL, and ETL Logic Data Book*, literature number SCED004.

HC/HCT
High-Speed CMOS Logic

For low-power logic requirements, TI offers a full family of HC/HCT logic. Over 100 device types are available, including gates, latches, flip-flops, buffers/drivers, counters, multiplexers, transceivers, and registered transceivers.

The HC family offers CMOS-compatible inputs and the HCT family offers TTL-compatible inputs.

For HC/HCT data sheets, see the 1997 *HC/HCT Logic High-Speed CMOS Data Book*, literature number SCLD001D.

IEEE 1149.1 (JTAG) Boundary-Scan Logic

The IEEE 1149.1 (JTAG) boundary-scan logic family of octal, Widebus™, and scan-support functions incorporates circuitry that allows these devices and the electronic systems in which they are used to be tested without reliance on traditional probing techniques.

Bus-interface logic devices are available in BCT, ABT, and LVT technologies in 8-, 18-, and 20-bit options of the standard buffers, latches, and transceivers. The universal bus transceiver (UBT™), which can functionally replace 50+ standard bus-interface devices, is featured at Widebus widths (18 and 20 bits). Package options for these devices include plastic dual in-line (PDIP), small-outline integrated circuit (SOIC), shrink small-outline package (SSOP), thin shrink small-outline package (TSSOP), and thin quad flatpack (TQFP). The scan-support functions include devices for controlling the test bus, performing at-speed functional testing, and partitioning the scan path into smaller, more manageable segments.

Over 40 devices, composed of a wide selection of BCT and ABT octals, ABT and LVT Widebus, and scan-support functions, are available. Bus-hold and series-damping resistor features also are available.

For JTAG data sheets, see the 1997 *Boundary-Scan Logic IEEE Std 1149.1 (JTAG)*, literature number SCTD002A.

LS
Low-Power Schottky Logic

With a wide array of functions, TI's LS family continues to offer replacement alternatives for mature systems. This classic line of devices was at the cutting edge of performance when introduced, and continues to deliver excellent value for many of today's designs. As the world leader in logic products, TI is committed to being the last major supplier at every price-performance node.

For LS data sheets, contact the Product Information Center at (972) 644-5580.

LV
Low-Voltage CMOS Technology

TI's LV CMOS technology products are specially designed parts for 3-V power supply use. The entire LV family also has been recharacterized to operate at 5 V.

The LV family is a 2-μ CMOS process that provides up to 8 mA of drive and propagation delays of 18 ns maximum, while having a static power consumption of only 20 μA for both bus-interface and gate functions.

The LV family is offered in the octal footprints with advanced packaging such as small-outline integrated circuit (SOIC), shrink small-outline package (SSOP), and thin shrink small-outline package (TSSOP).

For LV data sheets, see the 1998 *LVC and LV Low-Voltage CMOS Logic Data Book*, literature number SCBD152A, or the 1996 *AHC/AHCT, HC/HCT, and LV CMOS Logic Data Book*, literature number SCLD004.

TEXAS INSTRUMENTS

LVC
Low-Voltage CMOS Technology

TI's LVC logic products are specially designed for 3-V power supplies.

The LVC family is a high-performance version with 0.8-μ CMOS process technology, 24-mA current drive, and 6.5-ns maximum propagation delays for driver operations. The LVC family includes both bus-interface and gate functions with 70 different functions planned.

The LVC family is offered in the octal and Widebus™ footprints with all of the advanced packaging such as small-outline integrated circuit (SOIC), shrink small-outline package (SSOP), and thin shrink small-outline package (TSSOP) with planned thin very small-outline (TVSOP) additions.

All LVC devices are available with 5-V tolerant inputs and outputs.

For LVC data sheets, see the 1998 *LVC and LV Low-Voltage CMOS Logic Data Book*, literature number SCBD152A.

LVT
Low-Voltage BiCMOS Technology

The specially designed 3.3-V LVT family uses the latest 0.8-µ BiCMOS-process technology with performance specifications ideal for workstation, networking, and telecommunication applications. In addition to popular octal and Widebus™ bus-interface devices, TI also offers the universal bus transceiver (UBT™) in this low-voltage family.

Performance characteristics of the LVT family are:

- Speed – Provides high performance with typical propagation delays of 4 ns for buffers.
- 3.3-V operation with 5-V tolerant I/O – Capability to interface with a mixed-voltage environment. The I/Os can handle up to 7 V, which allows them to act as 5-V/3-V translators.
- Drive – The LVT family provides up to 64 mA of drive, yet consumes less than 100 µA of standby power at 3.3-V V_{CC}.

Additional features include:

- Live insertion – LVT devices also incorporate circuitry to protect the devices in live-insertion applications. The devices go into the high-impedance state during power up and power down, which is called powered-up 3-state (PU3S).
- Bus hold – Solves the floating input problem by holding the input at the last valid logic state. This eliminates the need for external pullup and pulldown resistors.
- Damping-resistor option – TI implements series-damping resistors on certain devices, which not only reduces overshoot and undershoot, but also matches the line impedance, minimizing ringing.
- Packaging – LVT devices are available in the octal and Widebus™ footprints in packaging options such as small-outline integrated circuit (SOIC), shrink small-outline package (SSOP), and thin shrink small-outline package (TSSOP).

For LVT data sheets, see the 1998 *LVT Low-Voltage Technology Data Book*, literature number SCBD154.

TEXAS INSTRUMENTS

S
Schottky Logic

With a wide array of functions, TI's S family continues to offer replacement alternatives for mature systems. This classic line of devices was at the cutting edge of performance when introduced, and continues to deliver excellent value for many of today's designs. As the world leader in logic products, TI is committed to being the last major supplier at every price-performance node.

For S data sheets, contact the Product Information Center at (972) 644-5580.

SSTL
Stub Series-Terminated Logic

SSTL is the computer industry's leading choice for next-generation technology in high-speed memory subsystems, adopted by a Joint Electronic Device Engineering Committee (JEDEC) standard and endorsed by major memory module, workstation, and PC manufacturers.

The SSTL16837 is the industry's first device for driving 3.3-V address signals from a low-voltage memory controller to SDRAMs using SSTL technology. In designs operating at >75 MHz, the SSTL16837 provides fast address signaling with minimal propagation delay. The SSTL16837 converts LVTTL signals from the memory controller to SSTL signals that are used by the SDRAM input pins. Targeted users of the device initially include workstations and servers, with eventual migration to PCs, as high-speed memory subsystem technology evolves in desktop systems.

HSTL
High-Speed Transceiver Logic

TTL
Transistor-Transistor Logic

With a wide array of functions, TI's TTL family continues to offer replacement alternatives for mature systems. This classic line of devices was at the cutting edge of performance when introduced, and continues to deliver excellent value for many of today's designs. As the world leader in logic products, TI is committed to being the last major supplier at every price-performance node.

For TTL data sheets, contact the Product Information Center at (972) 644-5580.
